

Observations 4: 4D-Var continued / Reanalysis

OUTLINE:

- IR vs MW impacts
- 4D-Var : Minimising the cost function
 - Example: Adjoint calculation for cloudy radiance assimilation
- Reanalysis

A comparison of moisture increments from MW vs IR

IASI - 31 WV channels
(there are many more !)

SSMIS SSMI-like channels +
3 × 183 GHz channels

Averaging kernels
computed from
H, B and R matrices.

SSMI adds large 'energy'
increments

The Impact of SSMIS window (SSMI-like) channels in NWP

Met Office Global Model

Data Assimilation: 4D-Var

Data assimilation combines information from

- Observations
- A short-range "background" forecast that carries forward the information extracted from prior observations
- Error statistics
- Dynamical and physical relationships

This produces the "most probable" atmospheric state (maximum-likelihood estimate)***

*** if background and observation errors are Gaussian, unbiased, uncorrelated with each other; all error covariances are correctly specified; model errors are negligible within the 12-h analysis window

$$J(\mathbf{x}) = \underbrace{(\mathbf{x}_b - \mathbf{x})^T \mathbf{B}^{-1} (\mathbf{x}_b - \mathbf{x})}_{\text{background constraint}} + \underbrace{[\mathbf{y} - \mathbf{h}(\mathbf{x})]^T \mathbf{R}^{-1} [\mathbf{y} - \mathbf{h}(\mathbf{x})]}_{\text{observation constraint}}$$

$$\mathbf{h}(\mathbf{x}) = \mathbf{h}[\hat{\mathbf{I}}(\mathbf{x})] \quad \text{simulates the observations}$$

COST Summer School Cargèse, Sept 14-26th 2009

- Rain assimilation operational since June 2005 at ECMWF with SSM/I data over global oceans
- Observing System Experiments (OSE) for summer 2006 (Kelly et al. , EUMETSAT support)

REANALYSIS

Atmospheric reanalysis: The user base

- Many users:
 - 12000 registered users of ERA public data server
 - ~5M fields retrieved daily by ECMWF and Member-State users
 - National mirror sites for ERA in many countries

- And many citations:
 - Paper on NCEP/NCAR reanalysis is most cited paper in geosciences
 - Paper on ERA-40 is most cited recently in the geosciences
 - Many references in IPCC Fourth Assessment report

December 2008

Reanalysis

- ❑ The observations are used to correct errors in the short forecast from the previous analysis time.
- ❑ Every 12 hours we assimilate 4 - 8,000,000 observations to correct the 100,000,000 variables that define the model's virtual atmosphere.
- ❑ This is done by a careful 4-dimensional interpolation in space and time of the available observations; this operation takes as much computer power as the 10-day forecast.

Data sources: Conventional

SYNOP/SHIP/METAR:

- Meteorological/aeronautical land surface weather stations (2m-temperature, dew-point temperature, 10m-wind)
- Ships
 - temperature, dew-point temperature, wind (land: 2m, ships: 25m)

BUOYS:

- Moored buoys (TAO, PIRATA)
- Drifters
 - temperature, pressure, wind

TEMP/TEMPSHIP/DROPSONDES:

- Radiosondes
- ASAPs (commercial ships replacing stationary weather ships)
- Dropsondes released from aircrafts (NOAA, Met Office, tropical cyclones, experimental field campaigns, e.g., FASTEX, NORPEX)
 - temperature, humidity, pressure, wind *profiles*

PROFILERS:

- UHF/VHF Doppler radars (Europe, US, Japan)
 - wind *profiles*

Aircraft:

- AIREPS (manual reports from pilots)
- AMDARs, ACARs, etc. (automated readings)
 - temperature, pressure, wind *profiles*

Example of conventional data coverage

nate System.

ECMWF Data Coverage (All obs) - SYNOP/SHIP
09/OCT/2005; 12 UTC
Total number of obs = 29131

ECMWF Data Coverage (All obs) - TEMP
09/OCT/2005; 12 UTC
Total number of obs = 589

ECMWF Data Coverage (All obs) - BUOY
09/OCT/2005; 12 UTC
Total number of obs = 5413

ECMWF Data Coverage (All obs) - AIRCRAFT
09/OCT/2005; 12 UTC
Total number of obs = 40926

Data sources: Satellites

Radiances (→ brightness temperature = level 1):

- AMSU-A on NOAA-15/16/17/18(/19), AQUA, Metop
- AMSU-B/MHS on NOAA-16/17/18(/19), Metop
- SSM/I on F-13, AMSR-E on Aqua
- HIRS on NOAA-17(/19), Metop
- AIRS on AQUA, IASI on Metop
- MVIRI on Meteosat-7, SEVIRI on Meteosat-9, GOES-11/12, MTSAT-1R imagers

Ozone (→ total column ozone = level 2):

- Total column ozone from SBUV on NOAA-17/18, SCIAMACHY on Envisat, OMI on Aura, (GOME-2 on Metop)

Bending angles (→ bending angle = level 2):

- COSMIC (6 satellites), GRAS on Metop, (GRACE-A)

Atmospheric Motion Vectors (→ wind speed = level 2):

- Meteosat-7/9, GOES-11/12, MTSAT-1R(, FY-2C), MODIS on Terra/Aqua

Sea surface parameters (→ wind speed and wave height = level 2):

- Significant wave height from Seawinds on QuikSCAT, AMI on ERS-2, ASCAT on Metop
- Near-surface wind speed from RA-2/ASAR on Envisat, Jason altimeter

Observations assimilated in ERA-Interim 4DVAR

The Role of Water Vapour in the Climate System,
COST Summer School Cargèse, Sept 14-26th 2009

Total number of observations over 20 years: exceeds 30×10^9

Reanalyses have to deal with very large numbers of observations, whose quantity vary over time

Reanalysis in practical terms: bias correction

- ❑ Variational bias correction

Aims at correcting observation and observation operator biases in an automatic, consistent and time-smooth manner

- **Requires data that are considered not biased:**
 - All in situ: surface stations, radiosondes, aircraft
 - GPS radio occultation
 - So far, only applied to satellite radiance data in reanalysis
- **Caveat: Not designed to handle model biases!**

Variational bias correction has become an important component of global reanalysis because it minimizes the impact of changes in radiance data (new instruments, re-calibration during flight...)

Introduction to reanalysis: The basic idea

- ❑ Reanalysis uses a modern data assimilation system to reprocess past observations
- ❑ It produces a detailed description of the atmospheric evolution over an extended period of time:
 - Gridded fields of observed meteorological parameters
(ps, T, u, v, q)
 - Additional parameters generated by the model
(rainfall, cloud parameters, boundary layer height, ...)
 - Consistent with observations (through data assimilation)
 - Consistent with the laws of physics (from model equations)

Why not use archived analyses used for NWP?

NWP systems are continuously upgraded:

- Improved resolution
- Changes in model physics
- Changes in forcing data (e.g. SST)

Unphysical changes in operational analyses

Zonal mean vertical velocity at 500hPa:

From ECMWF Operations

From reanalysis (ERA-15)

Applications

- ❑ “Observations” for verification and diagnosis
 - Forecast model development, calibration of seasonal forecasting systems, climate model development; use of data assimilation increments for identifying model errors
- ❑ Input data for model applications
 - for smaller-scales (global_regional; regional_local), ocean circulation, chemical transport, nuclear dispersion, crop yield, health warnings, ...
- ❑ Study of short-term atmospheric processes and influences
 - process of drying of air entering stratosphere, bird migration, ...
- ❑ Providing climatologies
 - ocean waves, resources for wind and solar power generation, ...
- ❑ Assessment of the observing system
 - providing feedback on observational quality, bias corrections and a basis for homogenization studies; contributing to data reprocessing activities
- ❑ Study of longer-term climate variability and trends
 - used with caution in conjunction with observational studies

Global atmospheric reanalysis products

The Role of Water Vapour in the Climate System,
COST Summer School Cargèse, Sept 14-26th 2009

Organization	Time Period	Resolution	Analysis Method
NASA Data Assimilation Office (DAO)	1980 to 1994	2x2.5° lat/lon ($\Delta x \sim 280\text{km}$) L20 (–p, top at 10hPa)	Optimal Interpolation (OI) with incremental analysis update
ECMWF (ERA-15)	1979 to 1993	T106 spectral ($\Delta x \sim 125\text{km}$) L31 (–p, top at 10hPa)	Optimal Interpolation (OI) with nonlinear normal mode initialization
NOAA NCEP and NCAR (R1)	1948 to present	T62 spectral ($\Delta x \sim 200\text{km}$) L28 (–p, top at 3hPa)	Spectral Statistical Interpolation (SSI)
NOAA NCEP and DOE (R2)	1979 to present	T62 spectral ($\Delta x \sim 200\text{km}$) L28 (–p, top at 3hPa)	Spectral Statistical Interpolation (SSI)
ECMWF (ERA-40)	1957 to 2002	T159 spectral ($\Delta x \sim 100\text{km}$) L60 (–p, top at 0.1hPa)	3D-Var, direct radiance assimilation
JMA and CRIEPI (JRA-25)	1979 to 2004	T106 spectral ($\Delta x \sim 125\text{km}$) L40 (–p, top at 0.4hPa)	3D-Var, direct radiance assimilation
ECMWF (ERA-Interim)	1989 to present	T255 spectral ($\Delta x \sim 80\text{km}$) L60 (–p, top at 0.1hPa)	4D-Var, variational bias correction of radiance data (VarBC)

Soon to come:

NCEP (CFSRR)	1979 to 2009	T382 spectral ($\Delta x \sim 38\text{km}$) L64 (–p, top at 0.2hPa)	Grid-point Statistical Interpolation (GSI) <i>with weakly coupled ocean</i>
NASA GMAO (MERRA)	1979 to present	0.5x0.67° lat/lon ($\Delta x \sim 74\text{km}$) L72 (–p, top at 0.01hPa)	Grid-point Statistical Interpolation (GSI)
JMA (JRA-55)	1958 to 2012	T319 spectral ($\Delta x \sim 63\text{km}$) L60 (–p, top at 0.1hPa)	4D-Var, variational bias correction of radiance data (VarBC)

ERA-Interim: after ERA-40 and before the next reanalysis

ERA-Interim

- ❑ 20+ years: 1989-2009, continuing near-real time
- ❑ Resolution: T255L60, 6-hourly (3-hourly for surface)
- ❑ Forecast model version late 2006 (Cy31r2)
- ❑ Analysis using 12-hourly 4D-Var
- ❑ Variational bias correction of radiance data (VarBC)
- ❑ Monthly updates of the product archive
- ❑ Member state users: full access via MARS
- ❑ All users: web access via ECMWF Data Server
- ❑ Copy of complete archive at NCAR ([http:// dss.ucar.edu](http://dss.ucar.edu))

Please visit: <http://www.ecmwf.int/research/era>

Quality requirements for reanalysis products

- ❑ Accurate representation of observations
 - Departures from assimilated data
 - Comparisons with independent data
- ❑ Physical coherence of analysed fields
 - Forecast quality
 - Validation of model-generated fields
 - Conservation properties
- ❑ Consistency in the time-dimension
 - Representation of climate signals
 - Assessment of trends

Water

Improvements in ERA-Interim, due to:

- Revised humidity analysis
- Better model physics
- 4D-Var
- Improved bias corrections for radiance data

Reanalysis and climate monitoring

Figure 3.18. Linear temperature trends (°C per decade) for 1979 to 2004 for the globe (top) and tropics (20°N to 20°S; bottom) for the MSU channels T4 (top panel) and T2 (second panel) or equivalent for radiosondes and reanalyses; for the troposphere (third panel) based on T2 with T4 used to statistically remove stratospheric influences (Fu et al., 2004a); for the lower troposphere (fourth panel) based on the UAH retrieval profile; and for the surface (bottom panel). Surface records are from NOAA/NCDC (green), NASA/GISS (blue) and HadCRUT2v (light blue). Satellite records are from UAH (orange), RSS (dark red) and VG2 (magenta); radiosonde-based records are from NOAA RATPAC (brown) and HadAT2 (light green); and atmospheric reanalyses are from NRA (red) and ERA-40 (cyan). The error bars are 5 to 95% confidence limits associated with sampling a finite record with an allowance for autocorrelation. Where the confidence limits exceed -1 , the values are truncated. ERA-40 trends are only for 1979 to August 2002. Data from Karl et al. (2006; D. Seidel courtesy of J. Lanzante; and J. Christy).

Benefits of reanalysis products as a **proxy for observations** are well established

Reanalysis for climate monitoring: **physically consistent ECVs** (essential climate variables)

In the climate community, reanalysis is still regarded as **unsuitable for trend estimation** (IPCC)

This view evolves as reanalyses become more consistent and rely on more observations

Summary & Important concepts

- ❑ Reanalysis does not produce “gridded fields of observations”
 - But it enables to extract information from observations in one, unique, theoretically consistent framework
- ❑ Reanalysis sits at the end of the meteorological research and development chain that encompasses
 - observation collection [measurement],
 - observation processing,
 - numerical weather prediction modelling, and
 - data assimilation
- ❑ Unlike NWP, a very important concept in reanalysis is the consistency in time
- ❑ Reanalysis is bridging slowly, but surely, the gap between the “weather scales” and the “climate scales”
 - Resolution gets finer
 - Covers longer time periods

Current status of reanalysis & Future outlook

- ❑ **Reanalysis has developed into a powerful tool for many users and applications**
 - It relies on the combined expertise of a large user community and feedback
 - An extended reanalysis project such as ERA-40 takes 7-10 years to complete
- ❑ **It is worth repeating as all ingredients continue to evolve:**
 - Models are getting better
 - Data assimilation methods are getting better
 - Observation processing is improving
 - The technical/scientific infrastructure for running & monitoring improves constantly
- ❑ **With ERA-Interim, we made good progress in key problematic conceptual areas:**
 - Dealing with biases and changes in the radiance observing system
- ❑ **Major challenges for a future reanalysis project:**
 - Bringing in additional observations (not dealt with in ERA-Interim)
 - Dealing with model bias (ultimately responsible for problems with trends)
 - Coupling with ocean and land surface
 - Providing meaningful uncertainty estimates for the reanalysis products
